```
The present sequence encodes winter rye (Secale cereale L. cv. Muskateer) CHT46 preprotein (see AAM98081). Mature CHT46 (see AAM98081) is a chitinase-like protein that has chitinase (antifungal) and antifreeze activities. CHT46 CDNA (ch-46) was obtained by isolating pathogens or other stresses, i.e. under conditions when only chitinases with antifreeze activity would be expressed, and then sorting the cold-induced chitinase CDNAs to determine which encoded proteins with ice-binding ability. CHT46 and CHT9 (see AAM98079-80) have been cloned and expressed in bacterial and yeast (Pichia) systems and in Arabidopsis thaliana. The chitinase-like antifreeze
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               201 caccaccygcaycacygacytcaaycycyayytcyccyccttcttcygccayacctc 260

The present sequence encodes a chitinase polypeptide. The specification describes glucosyl hydrolase family 19 chitinases (AAB18894, AAB18896, AAB18899, and AAB18900-015), and glucosyl hydrolase family 18 chitinases (AAB18895, AAB18897-98 and AAB18900-011. The level of chitinase in plants can be modulated to enhance disease resistance in crop plants and for control of pathogens. The chitinase polynucleotides are also useful as molecular markers for genotype in a plant, and for sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        maize chitinase genes encoding seven chitinases of glucosyl colase family 19 are useful for enhancing disease resistance in crop

The present sequence encodes a chitinase polypeptide. The specification describes glucosyl hydrolase family 19 chitinases (AAB18894, AAB18896, AAB18895, AAB18897-98 and AAB1800-01). The level of chitinases (AAB18895, AAB18897-98 and AAB1800-01). The level of chitinase in plants can be modulated to enhance disease resistance in crop plants and for control of pathogens. The chitinase polynucleotides are also useful as molecular markers for genotype in a plant, and for sequence
                                                                                                                                                                                                                                                                                                                                                                                                          crop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cettetteggecagaceteceaegagaceaeggaggaegaggaggegetgeegaeeagt 313

The sequence given represents the rice chitinase gene. The promoter region of this gene (see AAQ31407) is responsive to physical and/or biological stress. The pattern of expression of this gene in mature plants is characteristic. There is a low level of expression in leaves, a moderate level in plant stems and the highest level in roots and the male and female parts of the plant. The chitinase promoter sequence may be linked to a reporter gene for expression in mono- or dicotyledon plants. Expression of this reporter gene may be used to study patterns of development and controlled expression of plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       612

The present sequence encodes winter rye (Secale cerale L. cv. Muskateer) (HT9 preprotein (see AAM98079). Mature CHF9 (see AAM98080) is a chitinase-like protein that has chitinase (antifungal) and antifreeze activities. CHF9 cDNA (ch-9) was obtained by isolating mRNA from rye plants grown at low temperatures in the absence of pathogens or other stresses, i.e. under conditions when only chitinases with antifreeze activity would be expressed, and then sorthing the cold-induced chitinase cDNAs to determine which encoded proteins with ice-binding ability. CHF9 and CHF46 (see AAM98081-82) have been cloned and expressed in bacterial and yeast (Pichia) systems and in Arabidopsis thallana. The chitinase-like antifreeze proteins can be used: to increase freezing tolerance of plants and microorganisms; to increase field survival of plants, animals and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               microorganisms exposed to sub-zero temperatures; to inhibit ice recrystallisation in biological materials or foods; for cryopreservation and hypothermic protection of cells, embryos, tissues etc. (particularly human platelets); and to kill tumour cells. They are also used to inhibit initiation and progression of diseases or spoilage caused by low temperature pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          diseases or spoilage caused by low temperature pathogens (particularly fungi) in plants, frozen foods and any cryopreserved
                                                 New nucleic acid encoding antifreeze polypeptides from plants particularly with chitinase activity, used to impart frost, and pathogen, resistant to plants, for preservation of foods, cells
                                                                                                                                                                                      Claim 2; Fig 21a; 118pp; English.

The present sequence encodes a chitinase designated RCH10. The specification describes chimcric receptors which are used for modulating plant responses to pathogens. The receptors comprise a heterologous extracellular domain (e.g. from a Bril protein or RCH10 protein) and a kinase domain (e.g. from disease resistance protein Xa21). The Xa21 gene is a member of disease resistance genes referred to as RKK genes. When Xa21 is present in a transgenic plant, it confers resistance to Xanthomoras spp. The plant receptors containing heterologous domains are useful for modulating plant responses to pathogens including viruses, bacteria, nematodes, fungi or insects. The nucleic acids can be used to confer desired traits on essentially any plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Disease resistance protein; Xa21; RKK gene; transgenic plant; chitinase; Xanthomonas; plant pathogen; Bril protein; RCH10 protein; ss.

This sequence encodes Chitinase G. Chitinase is an enzyme which breaks down chitin, the major protein in insect exoskeletons. The coding sequence may be used in the construction of transgenic organisms, especially plants, to produce pathogen resistant corranisms. The genome of such transgenic organisms preferably contains more then one gene with pathogen inhibiting activity, each gene under the control of active promoters. The two gene products then show a synergistic increase in pathogen induced activity so that the transgenic organisms have a greater degree of resistance or resistance against a wider spectrum of diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       geagegigetectecategietegegegeacagitigacegeatgeitetecaecegeaaeg 190

                                                                                                                                  This cDNA encodes a floral organ-specific chitinase. The specification provides a promoter sequence (AAV49083) derived from rice associated with chitinase, specific to floral organs that allows expression of genes in the flower parts of monocotyledonous plants. The expression of desired genes specifically in the floral parts of monocotyledonous plants, allows modifications to be made in the structure or function of these parts allowing the introduction of desired characteristics such as increased resistance to bacterial attack.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1013

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ω,
.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence encodes a chitinase polypeptide. The specification describes glucosyl hydrolase family 19 chitinases (AAB18894, AAB18896, AAB18899, and AAB18992-05), and glucosyl hydrolase famiy 18 chitinases (AAB18895, AAB18897-98 and AAB18900-01). The level of chitinase in plants can be modulated to enhance disease resistance in crop plants and for control of pathogens. The chitinase polynucleotides are also useful as molecular markers for genotype in a plant, and for sequence shuffling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New maize chitinase genes encoding seven chitinases of glucosyl hydrolase family 19 are useful for enhancing disease resistance in crop plants by modulating its expression in plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            79 ggcgtgggctcggtcatcacgcggtcggtgtacgcgagcactctgcccaaccgcgacaac 138

                                                   This chimeric DNA sequence comprises the PR-Q plant pathogenesis-
related protein (PRP)-coding sequence,(1), and a promoter sequence
which enhances transcription of (1). This construct is used to
produce transgenic plant cells or -tissues with the ability to re-
generate into plants which are disease resistant.

This sequence represents a clone of the tobacco pathogenesis related (PR)

gene. This gene can be isolated using the method of the invention.

The method is for isolating a chemically regulatable DNA promoter

fragment from the 5' flanking region of a chemically regulatable gene in

the controlled expression of genes, under the control of a

consecul for the controlled expression of sequences which will be

consecul for the controlled expression of sequences which will be

connecoding regulatable sequence. This is useful in plants with a

connecoding regulatable sequence. This is useful in plants with a

conficie or pesticide detoxification mechanism under the control of a

conficie or pesticide to give optimal tolerance. The promoter fragment

conficie or pesticide to give optimal tolerance. The promoter fragment

controlling sequences which encode traits such as

controlling sequences which encode traits such as

controlling to dishappenent, make or female sterility, and the ability

cof the plant to withstand cold, heat, salt and drought. The chemical

induction of the promoter allows the regulation of production of

compounds, e.g. flavours, fragrances, pigments, natural sweeteners,

industrial feedstocks, antimicrobials and pharmaceuticals, by

compounds, e.g. flavours, interprobals and pharmaceuticals, by

biosynthesis or metabolite conversion, whose blosynthesis is controlled

by endogenous or foreign genes. The method allows control over the time

cand rate of gene expression either throughout the whole plant, or in

concalized tissues, to achieve e.g. fungal or insect resistance by for

instance dusting the leaves with the chemical regulator. Controlling the

                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a DNA molecule encoding a pathogenesis-related (PR) protein having beta-1,3-glucanase activity selected from PR-2, PR-2', PR-N', PR-N PR-0 and PR-0'. Also described are: (i) a chimeric gene comprising the above DNA molecule linked to a heterologous promoter; (ii) a vector containing the chimeric gene; (iii) a best cell containing the chimeric gene; (iv) a transgenic plant. The DNA molecule is used to produce transgenic plants are book molecule is used to produce transgenic plants disease or pest resistance. The present sequence represents a tobacco PR-Q protein encoding cDNA sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      251

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 671
                                                                                                                                                                                                              Gaps
                                This sequence was isolated from a P.hybrida cDNA library. It has 80 per cent homology with tobacco clone PROB30 which encodes extracellular chitinase PR-Protein R. The gene can be inserted into an appropriate plasmid for production of transgenic plants having resistance to fungal pathogens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             507 aacagcaatatggttctggatgacaccacagggtaacaagccatcttgccacgacgttat

Patent No. 5399680
GENERAL INFORMATION:
GENERAL LINFORMATION:
APPLICANT: LAMB, CHRISTOPHER J.
APPLICANT: LAMB, CHRISTOPHER J.
APPLICANT: LAMB PLANT DEFENSE GENES AND PLANT DEFENSE REGULATORY
TITLE OF INVENTION: ELEMENTS
NUMBER OF SEQUENCES: 26
CORRESPONDENCE ADDRESS:
ADDRESSEE: PETTY, SCHROEDER, BRUEGGEMANN & CLARK
STREET: 444 South Flower Street, Suite 2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
